

HerGuardian AI

Local AI Verification

What runs on-device, what requires the internet, and how user data interacts with AI features.

1. What Runs Fully On-Device

The following parts can run in the browser without AI inference:

- UI rendering
- Navigation
- Static educational content
- Form filling
- Basic validation
- Calendar interaction
- Local score display where logic is implemented locally
- Light and dark mode
- Browser-side PDF generation where supported

2. What Requires Internet Access

The following require internet access:

- Deployed website access through Vercel
- Google login
- Neon PostgreSQL database storage
- Razorpay payment
- Twilio SMS, OTP, and call alerts
- AI chatbot responses
- YouTube videos and external health article links

3. Does User Data Leave the Device?

Yes, only when the user uses cloud-connected features.

Data may be sent to:

- Neon PostgreSQL for account, assessment, appointment, report, and log storage
- Twilio for OTP, SMS, and call alerts
- Razorpay for payment processing
- Google OAuth for login
- AI provider for chatbot queries, depending on configuration

4. Fully Local AI Status

The chatbot and conversational AI-guidance layer depend on an external AI provider such as OpenAI, Gemini, or Puter.js-compatible APIs — this layer does not run fully on-device.

The platform's custom health score and mental wellness score model, however, runs locally within the application server and does not call an external AI provider for its predictions. Static pages, forms, UI, calendar interactions, and some report generation can also run locally in the browser.

5. User Data and AI

Sensitive health data should be minimized before sending to an AI provider. The chatbot is intended for educational support and safer next-step suggestions, not medical diagnosis.

This document reflects the current on-device and cloud-dependent behavior of HerGuardian AI and may be updated as the platform evolves.
